OBJECTIVES
The objective of this proposal
- Design and optimization of the equipment,
- Engineering and processing information for New indigenous Product (215V/400VA/50Hz Linear Alternator).

Details
The rotor is made up of with 3 permanent magnets and supported with pole shoes. Adjacent magnets have opposite polarity and a movement of the rotor creates an alternating magnetic field in the stator coils. The flux is led from the magnets through bars of magnetic steel, called pole shoes. The pole shoe enables control of the magnetic flux distributions in the periphery of the air gap and it also protects the magnets from transient magnetic fields generated by short circuit in the outer circuit.

Rotor of the linear alternator

Stator of the Linear Alternator

Details
The stator is made of laminated electrical steel. In this project 5 coils are used with 80 turns/coil and the total resistance is 30Ω. This winding Configuration aims at minimizing the fluctuation in the output power caused by cogging.
ACHIEVEMENTS

- Establishment of test facility
- Establishing a platform for Technological Capability
- Review of R&D in the proposed area (National & International Status, Importance, Patents, etc.)

a. Engineering design and desktop optimization of the alternator.
b. Detailed design and fabrication of components.
c. Assembly of the prototype and design refinements.
d. Testing of prototype and verification of performance parameter

Working
The translator acts as the rotor that moves linearly while the stator is fixed. Permanent magnets are attached to the rotor and the stator carries the windings.

With the movement of the jigsaw the rotor is moving up and down linearly. As the rotor is having the magnets on it, it produces strong magnetic field which cuts the flux in the winding, inducing the e.m.f.

This generator design is best suited for the generation of the electricity from the wave energy.
